

Treatment planning with MMCTP

Andrew Alexander, Jan Seuntjens

Medical Physics Unit
McGill University

June 18, 2011

Layout

- 1 Setup
 - McGill RT import
 - Linac Configuration
 - CT to Density
- 2 TPS
 - Treatment Planning Window
 - External beam options
- 3 MCTP
 - BEAMnrc
 - BEAMnrc CM auto-scripts
 - EGSnrc
 - DOSXYZnrc

Patient Import Steps

- 1 File > Import > RT Patient
- 2 Select import format
- 3 MMCTP will browse the selected folder
- 4 Populate the import listbox with patient name and ID
- 5 Select the patient and press transfer (it takes time to transfer)
 - 1 Raw DICOM read
 - 2 DICOM RT class read
 - 3 DICOM to McGill RT
 - 4 Write McGill RT
- 6 Patient is displayed in McGill listbox

DICOM header browser

- Task > DICOM header

DICOM file : RTPLAN_1.2.826.0.1.3680043.2.200.262933318.134.5361.2230

DICOM Classes

- 1 Four MMCTP DICOM classes: images, structure, plan and dose
- 2 Each class contains variables pertinent to the function of each type
- 3 Sequence and nested sequences within each class
- 4 Total of 27 MMCTP DICOM classes
- 5 MMCTP DICOM classes simplify reading, import, export and writing of DICOM

MLC Configuration

- File > Configurations > MLC tab

The screenshot shows the MMCTP Configurations window with the MLC Properties tab selected. The window title is "MMCTP Configurations". The top menu bar includes "Beam Configurations", "MLC", "CT to Density", "Monte Carlo Settings", "Shell Refresh", "Shell Run", "Shell Download", "Shell Login", "Preferences", and "Dose Stats". Below the menu bar, there is a dropdown menu showing "Varian 120M" and buttons for "Add MLC" and "Delete MLC".

The MLC Properties section contains the following fields and options:

- MLC Name:
- Type leafpairs Type binary leaves
- Number of leafpairs or binary leaves:
- Abutting leaf air gap (cm):
- Parse Sinogram:
 - Do nothing
 - Simple Parser
- Leaf Direction:
 - Parallel X
 - Parallel Y

A table below these fields shows the MLC leaf positions:

Bounds	Value (cm)
1	-20
2	-19
3	-18
4	-17
5	-16
6	-15
7	-14
8	-13

24	-3.5
25	-3
26	-2.5
27	-2
28	-1.5
29	-1
30	-0.5

Linac Configuration

- File > Configurations > Beam tab

The screenshot shows the MMCTP Configurations application window. The 'Beam Configurations' tab is active, showing various settings for a linac configuration. The 'Beam Mode' is set to 'PHOTON', the 'Linac Name' is 'CL21EX-A', and the 'Beam Energy' is '6'. The 'Linac Properties' section includes fields for 'Beam Mode', 'Linac name', and 'Energy', along with radio buttons for 'Type' (Varian, Siemens, Tomotherapy, Other). The 'MLC' section shows 'MLC Name' set to 'Varian 120M'. The 'MC Settings' section includes fields for 'BEAMnrc particle density', 'BEAMnrc input file', and 'BEAMnrc pegs file'. A table lists the BEAMnrc folders and their corresponding DOSXYZnrc dose values. The 'Electron Applicators' section has a 'Number of Applicators' field set to 0. The 'Dynamic Wedge' section shows 'GoldenSTTfile-6MV.txt'. The 'Physical Photon Wedges' section includes fields for 'Number of Wedges', 'Wedge', 'Wedges Angle', and 'Number of wedge orientations', along with a table for 'Index' and 'Orientation'.

BLOCK	Yes	Yes	Yes
SLAB	Yes	No	Yes
FLAT	Yes	No	No

* Auto-scripts are linked to particular linac manufactures and CM inputfile flags

BEAMnrc input file

- BEAMnrc classes are loaded dynamically per user selected plan
- For each external beam there is a BEAMnrc input file class
- First attempt to read input file from plan folder
- Second attempt to read input file from BEAMnrc-Setting folder, template input file for MMCTP linac
- Once found, the Z value of last scoring plane is read-in and stored as a parameter to be passed to DOSXYZnrc
- Last scoring plane must be a BLOCK or SLAB CM
- Input files are updated if the linac name or beam energy is changed

BEAMnrc Simulations user control

- 1 Turn on BEAMnrc auto run and auto refresh (Configurations Window)
- 2 Turn on global auto run and auto refresh (Configurations Window)
- 3 Check-on a BEAMnrc run (Treatment Planning Window)

BEAMnrc Simulations system control auto-run

- 1 If phsp database on, search database for match
- 2 If auto-shell on, determine shell
- 3 Generate input file, remove any previous input files on shell, upload new input files to shell
- 4 Run test run to determine particle per history density and CPU time per history
- 5 Calculate the required number of histories and update the estimated simulation time
- 6 Generate input file, remove any previous input files on shell, upload new input files to shell
- 7 Summit job to shell queueing system

BEAMnrc Simulations system control auto-refresh

- 1 Search for lock file, read progress
- 2 If lock file not found, search for `_w` log files
- 3 If all `_w` log files exist and contain “Simulation finished” run `addphsp`
- 4 `Addphsp` script is generated locally, transferred to shell and submitted to queueing system
- 5 Search for `addphsp` log for “Done”
- 6 Run `BEAMDP` on new `phsp` file, read number of photons and particles
- 7 Update `phsp` database
- 8 Remove `_w` files

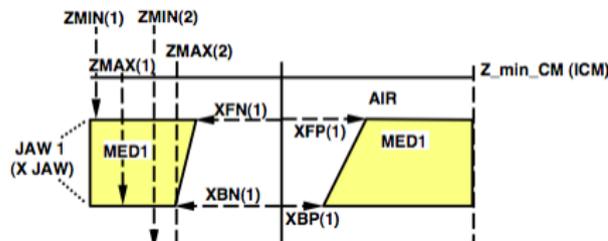

Auto-script CM JAWS

```

x1=-gRTOG.Plan(Plan_Index).Beam(beam_number).Collimator.fields(0).X1
x2=gRTOG.Plan(Plan_Index).Beam(beam_number).Collimator.fields(0).X2

  cm.JAWS.XBN_JAWS(i-1)=zxbot*x1/100

```

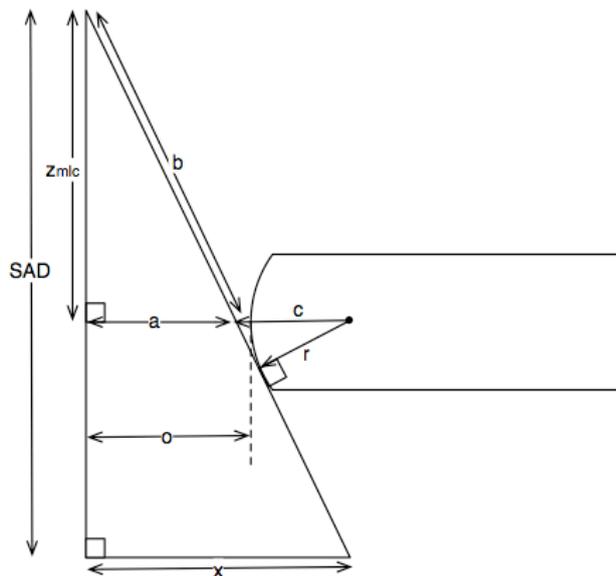

JAWS

Auto-script CM DYNVMLC

MLC field is defined at isocenter, required to convert the MLC leaf projections at isocenter to the MLC leaf positions within BEAMnrc.

Back-projection is complicated by rounded leaf ends of the MLC.

Auto-script CM DYNVMLC

- Varian Script is defined within the methods of the class BEAM, under the title `egs_Input_CM_DYNVMLC_MLC2BEAM_Varian`.
- This script is unique to Varian millennium type MLCs with rounded leaf ends.
- In the event that the MMCTP beam does not contain a MLC pattern, a default retracted MLC position of 20.3 cm is used for each leaf.

Auto-script CM APPLICAT

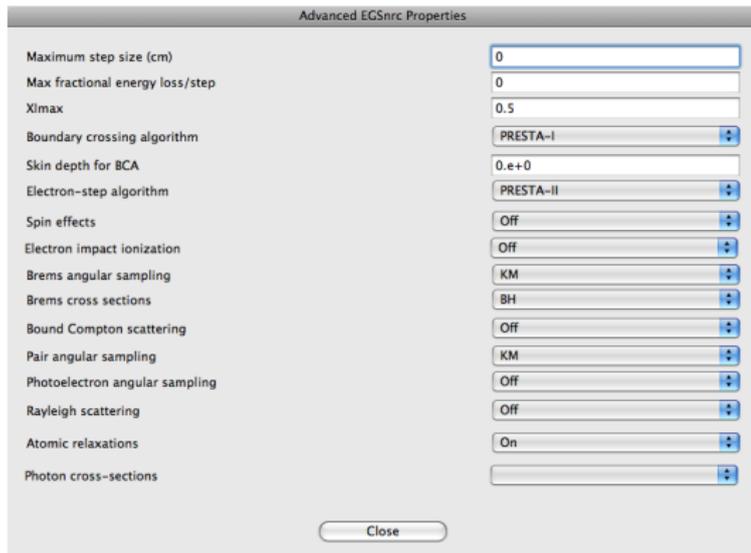

- Values are not edited
- The whole CM section is replaced with an APPLICAT file
- Each linac applicator is linked to an APPLICAT file
- APPLICAT files are stored within the MMCTP BEAMnrc folder
- Same approach for WEDGE CM

```
**** start of CM APPLICAT with ident  
27, RMAX  
5x5 applicator  
78.54, ZBACK  
2, 0, #SCRAPERS, SQUARE  
63.75, 1.65, 3.58, 4.42, 0, 0  
76.5, 2.025, 3.305, 4.695, 0, 0  
0.521, 0.01, 0, 0,  
BISNICRU700  
BISNICRU700
```

EGSnrc settings

- Accessible for both BEAM/DOS
- Read-in from template input file
- MMCTP does not auto edit these settings

DOSXYZnrc Main Window

- ability to start calculation
- progress bars for dose calculation status
- access to DOSXYZ input parameters
- access to EGSPphant creation tools

DOSXYZnrc

- Phantom definition
- Edit dosxyznrc parameters
- Source definition access
- Variance reduction techniques access

DOSXYZnrc - source type definition

- Automatically determines values from the External Beam tab information
- Values are determined upon test run

Source 9 options

Exclude Fat Photons from DBS

BEAM sim with no LATCH filter

BEAM sim with latch

1 BIT FILTER=0

Isocenter (x,y,z) -0.07 56.34 -6.73

Angles (theta,phi,coil) 0. 0. 0.

Distance from source to isocenter 30.

BEAM simulation: BEAM_6X_DYNJAWS_DYNVMLC

input file: QA_PHANTOMNEW_37943_p01b1

pegs data: MLCicru

e split 51

DOSXYZnrc - source type definition - link to external beam definition

- Automatically determines values from the External Beam tab information
- Values are determined upon test run

Beam Properties

Beam Number: 1

General | **Geometry** | Accessories | Electron

Field Type: MU Backscatter % (all fields) 2.483

Number of fields: 1 Index of field: 1

Angles

Gantry (deg): 0 Collimator (deg): 0 Couch (deg): 0

Isocenter

X (cm): -0.071 Y (cm): 6.7333 Z (cm): -56.34

Distance

Nominal Isocenter Distance (cm): 100 Source to Skin distance (SSD) (cm): 0

Field Size

X (cm): 10 X1: 5 X2: 5 Y (cm): 10 Y1: 5 Y2: 5

Diagram showing field size parameters X1, X2, Y1, Y2.

Patient Information:

Name: Q4 phantom
PatientID: Q4_PHANTOM
Y: 7.1 cm (257/512)
X: -11.43 cm (259/512)
Z: -63.47 cm (-76/11)

H	Dose	Dose Profiles
(cm)	Y2 (cm)	X (cm) Y (cm)
5.	-0.07	6.
5.	-0.07	6.
8.	-0.07	6.
5.	-0.07	6.

DOSXYZnrc - source type definition - link to external beam definition

center of source plane **ISOURCE = 2**

The diagram on the left illustrates the geometry of a source plane. A yellow square represents the source plane, with its center labeled 'center of source plane'. A point 'phicol' is marked on the plane. A dashed line 'dsource' connects the center of the source plane to the isocenter. The isocenter is labeled '(xiso,yiso,ziso)'. The angle between the source plane normal and the isocenter direction is 'theta'. The angle between the source plane normal and the collimator axis is 'phi'. A coordinate system with axes X, Y, and Z is shown.

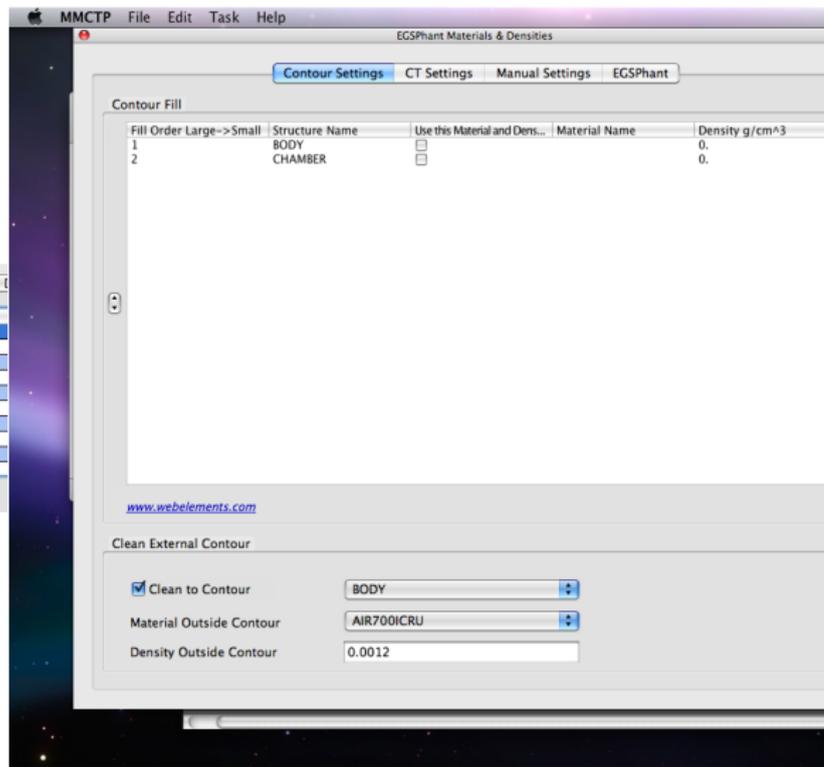

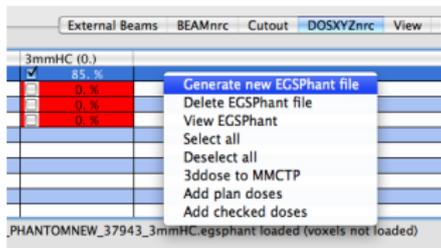

The 'Source 9 options' dialog box on the right contains the following settings:

- Exclude Fat Photons from DBS
- BEAM sim with no LATCH filter
- BEAM sim with latch
- 1 BIT FILTER = 0
- Isocenter (x,y,z): -0.07, 56.34, -6.73
- Angles (theta,phi,coll): 0, 0, 0
- Distance from source to isocenter: 30
- BEAM simulation: BEAM_6X_DYNJAWS_DYNVMLC
- input file: QA_PHANTOMNEW_37943_p01b1
- pegs data: MLCicru
- e split: 51

DOSXYZnrc - phantom creation

DOSXYZnrc - phantom creation

- Selection of resolution and boundaries
- Selection of material data set
- Selection of name (Note: length)
- Possibility to generate mathematical phantom

DOSXYZnrc - phantom creation

- Contour filling and material assignment
- Regions are assigned by specifying material + density
